

## ABSTRACT OF THE DISCLOSURE

Disclosed is a roll-up blind with safety arrangement. The blind comprises a headrail, a brake mechanism proximate the headrail, a cord having one end passed the brake mechanism to form an operable portion, a shade cloth  
5 coupled to the headrail, the shade cloth having a lower end coupled to the other end of the cord, and a plurality of cord covers formed on the shade cloth to cover the other end of the cord. Whereby pulling the operable portion of the cord will cause the shade cloth to wrinkle upwardly and the cord covers to contract together. Most importantly, a dangerous ring will not be formed by the  
10 cord and the cord covers in operation. Also, the shade cloth is wrinkled upwardly and the cord covers are contracted together to form aesthetic members in response to drawing up.
